Reflection

I learned to build more into my background for the game instead of a solid background camera. I started to install parallaxing backgrounds and a bit in the foreground items that the player does not interact with. By changing the background, I had to change the camera view from orthographic to perspective to give space for the backgrounds. I also learned to add enemies, collectables and dust particles in the scene as well. Through the help of outside resources like YouTube and AI. I used AI to help understand the code from the video I was watching. Since it was an older version of Unity, I needed a translator for certain parts in the code to write it up to date. I also had questions about the code, so I also asked AI about that. I used AI to help me understand the code more and most of the time I do the code on my own while following a video. I was able to understand the trampoline part in my code, since it felt familiar from going through tutorials. So, I tried to take a crack at it and was able to make it work. Throughout my works in this small game, I found making the enemy challenging and having to work with animations in my game. For the enemy, I had ray casting to detect walls and edges, but sometimes the enemy would not move unless the player pushes the enemy. I have not yet figured it out, but instead I just placed the enemies in ways that the bug does not happen. For the animations, I had trial and error on the trampoline part. Instead of the player animations where the idle, walk, and jump all transitions into each other, I had to do it differently for the trampoline because it wasn't a looped animation like my player movements. I learned that my bounce animation had to transition into my idle instead of my idle transitioning into my bounce and vice versa. Took me a bit to figure that out, but I was able to do it. In my game I would add the UI counter for when the player collects the fruits, and it would show up once the player wins. It will show the number of fruits they collected. I want to improve on my UI panels as well instead of just a solid color background, but more stylized to fit the vibe of the rest of the game. The current UI was just a placeholder, until I made a better UI screen for players to interact with. Overall, I had a big learning experience when making these elements and I hope I can grasp all the code overtime and know exactly what I'm doing one day.
